

Built for events, not dashboards.

Beyond turns real-time signals into alerts, decisions, and action.

THE PROBLEM

The problem is not data. It's reaction time.

Operational data already exists across control systems, historians, ERPs, and external sources. But it stays trapped in dashboards, control rooms, and specialized tools.

As a result:

- Decisions arrive late
- Field teams lack real-time visibility

WHAT BEYOND IS

Beyond is not a dashboard. It is an execution layer.

Beyond continuously transforms operational signals into actions — without manual polling, reporting, or human babysitting.

- No dashboards to watch
- No reports to chase
- No delays between signal and action

WHAT BEYOND CONNECTS

- PLCs, SCADA, and historians
- ERP and maintenance systems
- Operational, HR, and business platforms
- External and context data (weather, schedules, events)

If the data matters, Beyond integrates it.

WHERE INFORMATION IS DELIVERED

Information reaches the people who act.

- Mobile app
- WhatsApp
- Email
- Microsoft Teams

Real-time operational visibility — in the field, on the move, when it matters.

THE RESULT

- Faster, more confident decisions
- Less alert fatigue
- Greater operational autonomy

If critical information isn't reaching the right people — Beyond.
